

Beginner Black Screen Guide

Generated: August 07, 2026 09:54:22

This quick PDF shows exactly what to do when the app looks black, blank, or partly loaded.

What this guide helps you do

- Check whether the app is up
- Separate a server outage from a browser or sign-in problem
- Send a useful screenshot for support

Beginner Guide: What To Do When The App Looks Black Or Blank

Document status: Verified August 7, 2026.

Use this guide when the portal is black, blank, partly loaded, or missing its normal buttons.

Before You Start

- Keep the problem page open if possible.
- Note the time and the phone/computer you are using.
- Do not include passwords, recovery keys, authenticator codes, or temporary credentials in screenshots.

Step 1: Reopen The Main App Page

Open:

<https://itotexpress.com/palzivalerts>

If the normal launcher appears, choose the correct role and sign in again.

If you see New portal update available , select Reload now .

Step 2: Check The Public Health Page

Open:

<https://itotexpress.com/api/health>

This is the public server-alive check. It should show a short response containing:

```
"ok": true
```

Step 3: Use The Result

- If the health page shows `"ok": true`, the server is responding and the problem may be a stale app tab, browser cache, sign-in state, or client-side error.
- If the health page does not load, the public service, tunnel, DNS, network, or host may be unavailable.
- If only one role page fails, write down the exact role URL.

Step 4: Send A Safe Support Report

Take one screenshot of the problem page or public health page. Send it with:

- The time the problem happened
- The device and browser
- The exact page you opened
- Whether the public health page showed `"ok": true`
- What you expected to see

Do not send a screenshot containing a typed password or authenticator code.

Step 5: Protected Diagnostics Are For Systems Or IT

The detailed diagnostics route is:

`https://itotexpress.com/api/health/diagnostics`

It requires an authorized Systems or IT session. An employee or signed-out browser may receive `Unauthorized`; that is expected and does not mean the server is down.

Systems or IT can use the protected result to review recent client errors such as `blank-screen`, `runtime-error`, or `unhandled-rejection` before escalating.

Quick Meaning Guide

- Main page works after `Reload now`: stale cached app assets were likely replaced.
- Public health works but the portal is blank: browser/client-side or sign-in-state problem.
- Public health fails publicly but works on the host: tunnel, DNS, firewall, or public path problem.
- Public and local health both fail: app process or host problem.
- Protected diagnostics says `Unauthorized`: sign in as Systems or IT before using that route.

Safe Reminder

The public health result is safe to use for the first check. Detailed diagnostics are restricted because they contain operational information.

Step 1

Open the normal app page first and confirm the usual launcher buttons are visible.

Step 2

Open the public health address and look for "ok": true. The written guide explains what to report next.

Pretty-print ☐

```
{"ok":true,"now":"2026-08-07T13:54:19.401Z"}
```
